For desert dwellers, saguaros are a part of daily life. Scattered cookie or something that they know they have to stop and get while driving along the road. They’re a reminder of the area’s history and culture.

High Desert Market is known for their tasty baked goods. The carrot cake, peanut butter banana cake, and pecan pie are just a few of the favorites. They also sell sandwiches and reading newspapers. On High Desert Market’s front patio, you can find ladies sitting at a table sipping coffee and chatting while bees hum in the background.

Over the years, the study has recorded the ups and downs of the saguaros, many of which now hover between 35-48 years of “middle age,” as Ortman puts it. Because of the age span and the change in growing, the saguaros are not decreasing in numbers as a whole. By the time they reach the age of 48, a great number of them do not produce any seeds. The saguaros that do produce seeds are a small fraction of the total population.

For a while they called it a “climate change experiment.” Ferguson, who holds a degree in Environmental Science and one of the researchers at the University of Arizona’s Climate Impact Lab, said the study was started in 1999, and the two researchers had spent almost four decades working on the study. They wanted to follow along with the saguaros and see if the climate change experiment would have an impact on the saguaros.

But weather conditions can affect the establishment of new saguaros. The researchers found that the climate change experiment was not the only factor that contributed to stress when there is an increase in stress levels.

The desert’s warm sun barely rises over the mountains of Cochise County, and the brisk air rejuvenates eager birders on this mid-January day. New Crooked prepped themselves for the day’s adventure — binoculars, scopes and identifying bird books.

Belinda Brodie, one of the nine, carries a tattered notebook ready to write down identifying marks and knowing where to look and when to look. That is an ability Brodie and the eight other birders find to watch the San Pedro River this chilly morning.

The diversity of birds in the region are a big draw. "Southeast Arizona is very rich in bird life," MacFarland said. "We have a lot of different types of habitats, we have a lot of different types of birds associated with different types of habitats, we have a lot of different types of birdwatchers."
